Introduction

What you should already know

JavaScript and Java

Hello world

Variables

Introduction

JavaScript is a cross-platform, object-oriented scripting language. It is a small and lightweight language.

Inside a host environment, JavaScript can be connected to the objects of its environment to provide programmatic control over them.

```
const message = "Welcome to JS";
```

- Client-side features
- Server-side scripting

What you should already know

This guide assumes you have the following basic background configuration details:

A general understanding of the Internet and the World Wide Web (WWW) is highly recommended.

```
console.log("Understand Web Basics");
```

- Good understanding of HTML
- Working knowledge of CSS layouts

JavaScript and Java

JavaScript and Java are similar in some ways but fundamentally different in some core structures.

The JavaScript language design resembles Java but has an option-typing system and lacks strict static typing rules.

```
typeof "Java" !== typeof "JavaScript";
```
